

Facility Mapping

Create a map of your facility today

You have accurate plans of above-ground structures, get one of your utilities and buried infrastructure. The precise map created by Virtual Underground is capable of identifying and locating pipes, conduits and other structures from all commonly used materials including metal, plastic, cement and vitrified clay. Surface features (manholes, building lines, curbs, etc.) are included with the underground information allowing for simple and accurate locating. We can also collect any features required to merge our map with existing plans.

Begin with critical areas

Our technology allows us to collect areas over a period of time and then join them on a single map. If you need an immediate answer in one area we can come out and map it right away. Later, a map of covering a larger portion of your facility can be made by combining a new survey with the areas previously mapped.

A map for the future

Our maps are provided in both printed and electronic (CAD) format. Use the accurate and precise information to update existing facility plans or as the basis for a standalone map. Future changes or additions can be merged with the radar and surface survey providing a perpetual reference of your underground assets.

Office Buildings

Substations

Shopping Centers

Colleges

Universities

Golf Courses

Plants

Research Centers

Hospitals

Factories

Warehouses

Schools

Fields and Stadiums

Correctional Institutions

Convention Centers

Corporate Campuses

Minimal disruption

During our survey, our equipment has minimal interference with traffic flow and access, allowing for continuous operation of your facility. By steadily moving, the areas we work on remain open and accessible. Our process is also very quiet and can be scheduled around the needs of your workplace.

We leave your site just as we found it

We are a non-invasive and non-destructive process which require no digging or repaving. In many cases, our maps can help reduce the amount of excavation, time and cost required to complete a construction project.

Virtual Underground

Services Offered

Pre-Construction Planning
Site Investigation
Environmental Site Characterization
Infrastructure Mapping
Facility Mapping
Forensic / Archaeological
Assessment
